**Full text of Acidification of Ontario lakes : an assessment of their sensitivity and current status with respect to biological damage. Associated**

All phases may have to be passed through more than once due to new demands posed by a later phase.

**Life cycle assessment Part 2: Current impact assessment practice**

This makes collection of actual data for each process a time-consuming and sometimes even impossible activity. The use of both the sophisticated and simpler approach can be exemplified with the characterisation factors in this technical report. Air pollution in Europe 1997.

**Health impacts from cyanobacteria harmful algae blooms: Implications for the North American Great Lakes**

Recovery has occurred most strongly in lakes which have SO4 as a dominant acid anion, whereas recovery has been weaker in acidified humic lakes which have organic anion as a dominant acid anion. These critical load functions weighed for the size of the ecosystems can be used to construct so called protection isolines for the grid element.

The recovery of ANC was predicted to be incomplete. London United Kingdom , Chapman and Hall, United, 1998.

**Details**

The reports present the scientific discussions and documentation for recommendations offered by the guidelines. All emission quantities of a given substance are summed up along the life cycle, and are aggregated in the impact assessment phase LCIA with the summed emissions of other

substances contributing to the same impact. Net photosynthesis declined in epilithic periphyton in the middle littoral zone 1—2 m of both recently acidified basins in response to reduced concentrations of dissolved inorganic carbon.

**Статті в журналах:**

EDUCATION PRECOCE DE L ENFANT SOURD. The acidification factors relate the region of emission to the impact on its deposition areas. The factors do not anticipate the deterioration of the water quality as a result of this biomass growth.
