Nucleophillic Fluorination

Base strength is a rough measure of how reactive the nonbonding electron pair is; thus, it is not necessary for a nucleophile to be anionic. Use the BACK button on your browser to return to this page.

What is nucleophilic substitution?

Files available from the ACS website may be downloaded for personal use only. Preparation of alcohols Hydroxide ion is very effective for primary and secondary alcohols. S N2 occurs where the central carbon atom is easily accessible to the nucleophile.

1.24: Nucleophilic Substitution, SN2, SN1

Very strong nucleophiles, such as Grignard reagents or the hydride ion, add to the carbonyl in an irreversible reaction. Most of the reactions that are effective in synthesis involve S N2, because these are usually the cleanest, especially with primary alkyl halides.
