New trends in food consumption

Customized products and services will be offered by current mass brands as well as by niche brands targeting small consumer segments. Any product created by productivity of a consumer society, which is transformed from new technology, is considered a high-end enjoyment consumption good. It therefore provides an important opportunity to study lifetime dietary changes in relation to ageing.

Secular trends in food patterns of Guatemalan consumers: new foods for old

This article aims to study whether and how urbanization impacts dietary change. Outbreaks involving less common pathogens, such as *Bacillus cereus*, *Escherichia coli*, or *Giardia lamblia* are less likely to be confirmed because these organisms are often not considered in clinical, epidemiologic, and laboratory investigations of foodborne disease outbreaks.

Trends in food consumption over 30 years: evidence from a British birth cohort

Early identification and removal of contaminated products from the commercial market, correction of faulty food-preparation practices in food-service establishments and in the home, and identification and appropriate treatment of human carriers of foodborne pathogens are the main prevention and control measures that result from surveillance of foodborne disease. Rather, these data will be analyzed in detail, along with other relevant data, to answer questions of public health importance, and findings will be published in the scientific literature.

What the World Eats

With access to data never before available, the best businesses will generate data-driven personalized offerings. Fish poisoning due to ciguatera and scombrototoxin accounted for 73% of the outbreaks due to chemical agents.

What the World Eats

Beginning in 1923, the Public Health Service published summaries of outbreaks of gastrointestinal illness attributed to milk. We now have a near consensus that Americans should reduce their consumption of fat, especially saturated fat and cholesterol, consume a higher proportion of unsaturated fat, and eat less sugar and salt and more fruits, vegetables, and sources of complex carbohydrates.

Trends in Food Science & Technology

By 2027, household income will have increased by around 5% annually, with a massive number of industrial jobs redeployed to service sector jobs, and population movement from rural to urban areas, where incomes are higher. To succeed, businesses will need to make agility in innovation a core competency. The harder task will be finding talent with the fundamental soft skills of self-motivation, entrepreneurship and creativity and an eagerness for lifelong learning.
