Labour Force

Between 1930 and 1950, female labor force participation increased primarily due to the increased demand for office workers, women participating in the high school movement, and which reduced the time spent on household chores. The projected labor force growth over the 2014—24 period will be affected by the aging of the baby-boom generation, those born between 1946 and 1964. Interviews conducted over 2 one-week periods, previously 4 one-week periods.

Labour Force

A growing working-age population provides opportunities for economic growth while at the same time creating challenges for job creation and integration of new labour market entrants. The next-youngest members of the group, the 65-to-74-year-olds, had a participation rate of 21.

Labor Force Data

Another factor that may have contributed to the trend was the , which aimed at abolishing wage disparity based on sex.

Population and labour force

Some sources such as the American Community Survey and the Current Population Survey are survey based, relying on individuals to report their labor force status.

Population and labour force

Data are based on payroll reports from a sample of over 390,000 establishments employing over 47 million nonfarm wage and salary workers. The new classification affected comparability of data. In contrast to the declining trend of the youth labor force, the number of workers 55 years and older in the labor force grew from 15.

Labor force projections to 2024: the labor force is growing, but slowly : Monthly Labor Review: U.S. Bureau of Labor Statistics

In a similar, though not as dramatic, vein, the participation rate of 20-to-24-year-olds decreased by 2. Younger people are staying in school longer in order to be able to obtain better paying jobs in the future; thus, they are entering the labor force later.

Labor Force Data

Together these two groups of the working-age population represent the supply of labour for the production of goods and services in exchange for remuneration existing in a country at a given point in time. Estimates and benchmarks based on 1976 Census data, with series from August 1971 onwards revised to 1976-based benchmarks.

Labor Force Projections : U.S. Bureau of Labor Statistics

Over the next decade, because the 55-years-and-older group will shift to older age groups with lower participation rates, it is likewise projected to have declining participation rates. June 1989 'Family type' class 'Other families' split into 'One parent families' and 'Other families'. If, through a different immigration policy, more immigrants enter the country, then the growth of the population, and thus the growth of the labor force, will be greater.
