ISPRS

For example, the remit of a typical electromagnetic survey may be to identify a response that is consistent with a buried metallic target, rather than identifying the specific metallic elements involved.

Geophysical Methods, Exploration Geophysics » Geology Science

A second rule of thumb is that unless you are very close to the body, its exact shape is not important. One error is based on the estimate of the amount of material present above and absent below an assumed flat surface through the station.

Geophysical Methods

As a rule of thumb, the depth of maximum sensitivity for resistivity sounding is about 1. Geophysical records, even when made using legitimate instruments, are also of little value unless the data is collected and interpreted correctly.

Geophysical Methods in Mineral Exploration

Nuclear Magnetic Resonance NMR NMR is mainly used for groundwater exploration. Identifying spatial variability in the elevation of this interface across the site is crucial to improve modeling of groundwater flow and transport of uranium from the aquifer towards the river. Single-hole, directional radar can be used to identify the location and , and cross-hole tomography can be used to delineate fracture zones between boreholes.

Geophysical Methods in Archaeology

Radar from the air is seldom of use to the archaeologist these days except for large sites covered by jungle such as are found in the Yucatan or Central America.

Geophysical Method

The best method that may be used depends upon what is being sought. Geophysics, 77 6 , E397-E409. Density estimates may also be obtained

from geophysical well logging.

Geophysical Methods

For example, several hundred linekilometers of airborne electromagnetic surveying can be done in a day compared with three to five line-kilometers per crew in a ground electromagnetic survey.

Geophysical Methods, Exploration Geophysics » Geology Science

The horizontal axis is the ratio of depth to diameter. You are using a browser version with limited support for CSS. It is to be hoped that more opportunities and sources of funding will develop so that modern geophysical methods can assist the archaeologist even more frequently than has been possible in recent years.
