Hope Rockslides, British Columbia, Canada

For additional details on significant earthquakes in eastern Canada, see Lamontagne 2002. The direction of the vibrations was southeast to northwest. Damage outside the epicentral area was correlated with underlying unconsolidated sediments; for example, nearly 350 km from the epicentre, the former Montreal Est City Hall built on 17 m of clay suffered severe damage to its masonry cladding.

Early History of the Canadian Seismograph Network

G Genre: Geologie allg Buchtitel: Seismic Activity in Canada, West of the 113th Meridian 1841-1951 Online-Streitbeilegung gemäß Art. A slight earthquake was felt all over the city at 3:16 this afternoon. Similarly the level of geological knowledge about the volcanoes is insufficient to create hazard maps.

La petite histoire du réseau sismologique du Canada

Clark Nettleton, who was in the same building, said it was his first experience of an earthquake such as he had read about, and he will return to a study of the fall of Lisbon, the overthrow of a Pompeii and the experience of Charleston with a considerably heightened interest. Part of the audience fled in one direction and the performers, in their stage costume, wigs and paint, in the other.

Hope Rockslides, British Columbia, Canada

In eastern Ontario and southern Quebec, landslides triggered by earthquakes have been observed in the marine clays of the St. These networks provided, for the first time in Canada, real-time access to seismic data. Near Parent, QC 300 km away from the epicentre, 30 m of railroad embankment slid away.

Seismic Activity in Canada, West of the 113th Meridian 1841

Based largely on the distribution of hundreds of aftershocks that occurred in the months after the earthquake, the rupture zone is estimated to have

extended along a 500-km long section of the fault Fig. McLeod et Callendar 1897 , de l'Université McGill, ignoraient de toute évidence l'existence du sismomètre du Docteur Swallowood.

Similarly, in eastern Canada, amplification of ground shaking associated with thicknesses of soft Leda Clay has resulted in enhanced damage during past earthquakes Hodgson 1945; Lamontagne 2009. On average, earthquakes large enough to be felt occur every week in Canada, damaging earthquakes are years to decades apart, and some of the world's largest earthquakes are typically separated by intervals of centuries.
