After commencing the inquiry I found that the circumstances were calculated for affording even more conclusive evidence than I had anticipated. Snow acted like a detective, hunting down the source of a bad outbreak near his Soho neighborhood of London in 1854. Cholera on the Oregon Trail (Thesis)

Between the epidemics of 1849 and that of 1853, one of the water companies supplying the south districts of London changed its source of supply from the middle of the town, near the foot of the Hungerford Suspension Bridge, to Thames Ditton, at a part of the river which is beyond the influence of the tide, and, therefore, out of reach of the sewage of the metropolis. Even today, the best way to prevent getting cholera, just like in past centuries, is to avoid coming in contact with contaminated water or bodily fluids from someone who has cholera. As the first four weeks of the epidemic did not furnish a sufficient number of cases in all the subdistricts to serve for a statistical inquiry in detail, I have commenced by taking the first seven weeks of the epidemic collectively; and the first of the tables which accompanies this paper exhibits the results of my personal inquiry, when placed in connexion with the number of persons and houses supplied in each subdistrict by each water company respectively.

HIST 234

Transmission was limited, but sustained, in mid December and continued at low levels through the spring. In the first four weeks of the epidemic of 1854, that is, from July 9th to August 5th inclusive, there were 334 deaths from cholera in the districts to which the supply of the two water companies we are considering extends. The line has not been very accurately drawn where a street, as often happens, is partly in one district and partly in another; and thus, in the recent Report, the subdistricts of St.

Residents of IDP camps have been largely spared from the outbreak because of safer water supplies and improved sanitation in the camps, but preserving that protection as persons move on to homes without piped water or sewage systems will be a challenge.

Since disease prevention and behaviors are very much a product of cultural beliefs, this made it possible for a entire family or the bulk of some families to be wiped out. The earliest forms of dysentery would have prevailed in regions where numerous buffalo were slain and left to rot by the hunters.
