SURGERY, P.C.

Peripheral branches of the brachial plexus may be injured after their exit from the axilla, and these injuries may manifest as isolated nerve deficits; for example, the median and ulnar nerves can be damaged if the arm is allowed to hang unsupported over edge of the operating table, whereas the radial nerve of the downside arm may be injured if the arm is pushed cephalad against the vertical bar of the anesthesia screen, thus compressing the nerve between the humerus and the bar.

Schedule an with a urologist to find out more. After general anesthesia is established, patients should be placed in the lateral decubitus position with the nonoperative side against the operating table. The analysis of qualitative data showed that improvement in SF was a result of cure of POP and SUI symptoms.
