They might build theories about the atomic structure of matter, guided by the hints given by many experiments. The most commonly used tracer is technetium-99m, a metastable nuclear isomer chosen for its relatively long half-life of six hours and its ability to be incorporated into a variety of molecules in order to target different systems within the body. The collection has over 450 written by scholars and teachers covering the fields of history, literature, art and culture, and foreign languages.
