Myringosclerosis in patients with chronic renal failure: comparative analysis with a control group

Behavioral attacks similar to absence seizures could be provoked in behaving cats and monkeys by 3-Hz intralaminar thalamic stimulation. In 637 non-atherosclerotic patients with histories of ear infections, this figure was 114 17. He assigned, in his corticoreticular theory, essential roles in the genesis of discharges to both the cortex and the reticular system of thalamus and brainstem.

Myringosclerosis was found in 36 out of 300 non-atherosclerotic patients 12%. During the first few cycles the cortical focus drives the thalamus, which becomes entrained into the oscillation, thus providing a resonant circuitry. According to DJ Lane 1979 , bronchial asthma is a disease that is relatively easy to recognize but difficult to define.
