Dipterocarpaceae

Perhaps it allows the species to prevent localized extinction due to pollinator uncertainty or low population density, or perhaps it helps maintain genotypes well suited to distinct microhabitats, as can be found in the highly heterogeneous montane environment occupied by S.

Genetic Structure and Mating System of *Stemonoporus oblongifolius* (Dipterocarpaceae) in Sri Lanka

Selfing populations tend to have F values near 1.

Genetic Structure and Mating System of *Stemonoporus oblongifolius* (Dipterocarpaceae) in Sri Lanka

Distances were measured between the approximate centers of each sampling location using detailed contour maps. Our current knowledge of the population genetics and mating systems of rain forest trees is virtually confined to neotropical species. Taxon 26: 341—385 Maury, G.

Genetic Structure and Mating System of *Stemonoporus oblongifolius* (Dipterocarpaceae) in Sri Lanka

Where it occurs, generally at altitudes near cloud-level, it is a dominant canopy tree Greller et al.

Genetic Structure and Mating System of *Stemonoporus oblongifolius* (Dipterocarpaceae) in Sri Lanka

Nine of the 24 trees sampled had individual outcrossing estimates of less than 90%.
