Estimating residential demand for electricity in the United States, 1965

Oil products can be rationed, or domestic energy production can affect oil demand. In this paper we attempt to identify some of the factors that have determined the level and pattern of energy demand in developing countries during the 1970s and early 1980s. Our empirical findings give support to a stable long-run relationship implying also short-run and long-run elasticities whose size and sign are comparable to other similar studies.

Nonetheless, the income elasticity remains close to one in most countries, and is well above one for some. Although consumption has been in decline, projections show that it is expected to rise again over the following two decades, with reaching similar levels those seen in 2005. In 2018, this came to 4,153 kilowatt hours.
