Liver Transplantation Part 1: Procedure and Techniques

Although, many surgical strategies have been developed to protect injured liver surgery, no one have gained worldwide acceptance. Six cases of re-excision contained four small lesions separate from the metastasis; one was a cyst and three were nodules of scar tissue related to previous surgery. This recommendation comes from our experience in managing several patients with cyst recurrence in this location from failed laparoscopic and open procedures.

Low CVP During parenchymal resection hepatic inflow occlusion, the main source of bleeding is backflow from the valveless hepatic veins. Microvesicular steatosis is usually related to more acute conditions such as acute viral infections, metabolic disorders, and various toxins but also to acute fatty liver of pregnancy. Continuous variables are reported as medians with interquartile ranges, while categorical variables are reported as counts and percentages.

Comparison of two different transection techniques in liver surgery

Pre-Operative Evaluation Baseline liver function tests were within the reference ranges for 45 patients 85% , while mild derangements were found in the remaining eight patients. Cite this article Gomez, A.

Operative Techniques in Liver Resection

Female gender and advanced age are the predominant risk factors for symptomatic hepatic cyst disease. Animals were re-explored on postoperative day 7 POD 7 and the transection surface of remnant liver was observed for fluid collection hematoma, biloma, and abscess , necrosis, and other pathologies.

A TSE T2 image showing 3 cm lesion which was indeterminate on ultrasound, also a second lesion of 7 mm. The surgeon must quickly connect the veins draining blood from the liver and reestablish portal vein flow into the liver.

Liver Transplantation Part 1: Procedure and Techniques

The liver can be divided into five sectors and further sub-divided into eight functional segments Fig. However, more research is needed in this field of surgery as the prevalence of steatosis and hepatitis-related liver cirrhosis is dramatically increasing together worldwide. Anaesthesia and surgical techniques Improvements in anaesthesia have been integral to the success of hepatic surgery, primarily through the use of low central venous pressure techniques for liver resection.
