## **Amnesic effects of bilateral lesions placed in the hyperstriatum ventrale of the chick after imprinting**

Indeed, potential receivers may have been unable to detect or locate stimuli with such a low duty cycle.

## **Amnesic effects of bilateral lesions placed in the hyperstriatum ventrale of the chick after imprinting**

Chicks were returned to the dark incubator, and, 15—20 h after the operation, their approach towards the training stimulus and to a second novel stimulus was measured. Consistent evidence has shown that, especially in the early stages of imprinting, the tendency to approach the familiar object can be temporarily reversed e.

The results of that study are related to those of the present study in which only one IMHV was intact during training. Shortly after hatch, chicks were transferred to a sound-proof rearing room and placed in groups of 10—15 same-aged chicks to mimic typical brood conditions for BWs.
