

Endocrine system

Academic Press - 10 Endocrine System Fun Facts

Description: -

-
 Sonar -- Environmental effects.
 Whale sounds -- Measurement.
 Humpback whale -- Monitoring -- Hawaii.
 Humpback whale -- Vocalization.
 Humpback whale -- Effect of sound on.
 Philosophy, Japanese
 Schiller, Friedrich, -- 1759-1805 -- Criticism and interpretation
 Endocrinology
 Fishes -- Physiologyendocrine system
 -
 Text + Kritik -- IV/05
 Fish physiology -- v. 2endocrine system
 Notes: Includes bibliographical references and indexes
 This edition was published in 1969

Filesize: 48.62 MB

Endocrine System: Facts, Functions and Diseases

The important role of thyroid hormones during embryonic development was first studied thoroughly in tadpoles during the early 1900s. Rising blood sugar levels stimulate the islet cells of the pancreas to produce insulin.

Hormones and the Endocrine System

When a water-soluble hormone binds to a receptor molecule on the surface of a cell, it triggers a reaction inside of the cell.

Endocrine system

The endocrine system consists of a series of glands that produce chemical substances known as hormones, which produce widespread effects on the body. EPO released by the kidneys travels to the red bone marrow where it stimulates an increased production of red blood cells. This interplay is referred to as the hypothalamic-pituitary axis.

Endocrine System: Facts, Functions and Diseases

The second hormone is oxytocin, which stimulates contractions in the muscles of the uterus during birth. You may feel a lump, notice one side of your neck appears to be different, or your doctor may find it during a routine examination.

The Endocrine System: Function, Organs, Hormones, and Conditions

True endocrine glands probably evolved later in the evolutionary history of the kingdom as separate, hormone-secreting structures. Insulin and glucagon are two endocrine hormones released by the pancreas.

Hormonal Imbalances and Depression

And then we would have prolactin, which is important in women for lactation, being able to breastfeed after delivering a child.

About the Endocrine System

The hormone-receptor complex switches on or switches off specific biological processes in cells, tissues, and organs. At that moment, his body undergoes a series of changes—a direct function of sympathetic activation—preparing him to face the threat. Exocrine Glands Exocrine glands have ducts that carry their secretory product to a surface.

The Endocrine System: Function, Organs, Hormones, and Conditions

Mineralocorticoid secretion is regulated by ACTH from the pituitary gland. The glands of the endocrine system are where hormones are produced, stored, and released. These drugs have the potential to provide a competitive edge by increasing muscle mass, strength, and endurance, although not all users may experience these results.
