

A comparison of benthic macroinvertebrate communities in small Appalachian streams draining mined and unmined areas

s.n - Assessing Different Mechanisms of Toxicity in Mountaintop Removal/Valley Fill Coal Mining

Description: -

-A comparison of benthic macroinvertebrate communities in small Appalachian streams draining mined and unmined areas

-A comparison of benthic macroinvertebrate communities in small Appalachian streams draining mined and unmined areas

Notes: 13

Baseline for Climate Change: Modeling Watershed Aquatic Biodiversity Relative to Environmental and Anthropogenic Factors (Technical Report)

Wildlife and Fishery Values of Bottomland Lakes in Illinois. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy form. EPA compared lengths of stream channel in Pigeonroost, Seng Camp, and Oldhouse from USGS estimates to estimates made by the permittee.

Creating a More Perennial Problem? Mountaintop Removal Coal Mining Enhances and Sustains Saline Baseflows of Appalachian Watersheds

Feeding ecology of diving ducks on Keokuk Pool, Mississippi River. Ecology and successional patterns of wet meadows, Rocky Mountain National Park, Colorado.

Appendix B. Wetland Biomonitoring Sites, Referenced by State

They are habitat generalists and their selection of prey reflects the environment in which they forage.

Bacterial community responses to a gradient of alkaline mountaintop mine drainage in Central Appalachian streams

Unmined sites were one in Upper Mud River upstream of surface mines, one unimpaired tributary and four Left Fork Mud River sites. Successful reestablishment of forest was further hindered by the tendency for mine operators to reclaim sites with grasses because they recognized that site conditions were poorly suited to trees.
