Free flaps in burn reconstruction

Range of articular motion was complete in 15 of 17 hands. Results: Twenty-one patients underwent reconstruction with a TDAP flap alone, while three received two perforator flaps, a TDAP and an anterolateral thigh flap or deep inferior epigastric artery perforator DIEP flap. Each anatomic region of the body has unique challenges that must be addressed to achieve a successful reconstruction.

Reconstruction of burn scar contracture deformity of the extremities using thin thoracodorsal artery perforator free flaps — Seoul National University College of Medicine

Note that the scar contracture has been released and the scar lengthened. It is delivered by a team of trauma surgeons General Surgeons that specialize in acute burn care.

Reconstruction of burn contractures of the anterior neck with pre

In the past, surgeons relied on incisional or excisional releases of scars and skin autografting. The purpose of this article is to present our experience in oncologic palatomaxillary repair with temporalis muscle flap TMF for medically compromised patients who are not ideal candidates for microvascular reconstruction at a Chinese tertiary referral hospital over a 15-year period 1998-2012. Release of burn scar contractures requires complete removal of the scars and resurfacing of the resulting defects.

Concepts in Early Reconstruction of the Burned Hand

Complex burns often require consultation with plastic surgeons, who assist with the inpatient and outpatient management of these cases.

Functional and aesthetic reconstruction of digital flexion contractures with full

Their growing bodies and skin will change often. If immature scars or an increasing deformity is present, and no urgent or essential procedure is

required, pressure garments and occupational and physical therapy are indicated.
