intervention.

## HIV

Tat is expressed as 72-amino acid one-exon Tat as well as the 86—101-amino-acid two-exon Tat, and plays an important role early in HIV infection. HIV prevalence is increasing worldwide because people on antiretroviral therapy are living longer, although new infections decreased from 3.3 million in 2002, to 2.3 million in 2012.

## Molecular Insights Into HIV Biology

All of these events may contribute to postintegration latency.

## HIV

Regimens that have used only two months of rifampin or rifamycin have been shown to have higher relapse rates, particularly for HIV-infected patients Munsiff, 2006. A matrix composed of an association of the viral protein p17 surrounds the capsid, ensuring the integrity of the virion

## HIV/AIDS denialism

At the time of submission, two additional copies of the application and all copies of the appendix materials must be sent to: Peter R. The development of effective microbicides represents an important component of future HIV prevention strategies. Not only is treatment of TB and HIV critical, but prevention is a lifesaving

particle.

### **Molecular Insights Into HIV Biology**

Morbidity and Mortality Weekly Report. If the project is in the early stages of development, will the strategy establish feasibility and will particularly risky aspects be managed? We also thank Jennifer Rundles, the librarian from Central Michigan University, for assisting the authors in the database search. While there are no drug interactions, few clinicians and patients opt for this treatment due to the need for injections for nine months.

### **CAB Direct**

Microbiology and Molecular Biology Reviews.
