The geology of Oldoinyo Lengai

Like the raised beaches, it has contributed its distinctive quota to the variously featured scenery of our country. It has a population of approximately 366,800. During the earlier history of the granite it has often occurred that chemical changes have been wrought in some of the felspars, mica, or hornblende; the alkalis or lime have been taken from the felspars, and the lime and magnesia may have been taken from the other minerals, and these have united again in different combinations to form new minerals.

Geology and Soil

From the point of view of the architect and builder, however, the minerals constituting these rocks may be ranged very simply into two groups: i those existing n8 GEOLOGY OF BUILDING STONES as grains the original sand grains and 2 those forming the cement which binds the grains together.

Structural geology and tectonic setting of the Sutherland Greenstone Belt, Kaapvaal Craton, South Africa

Old Red Sandstone and boulder-clay! According to Merrill, a very beautiful coarse red granite is found near Lyme in Connecticut; the red felspars have the unusual property of being clear and transparent; it is used in Newport and Rhode Island. In Worcestershire a gneissose granite occurs at North Hill, and a hornblende granite appears north of Wych, Great Malvern.
