Creating digital materials

Many large organizations develop and manage their own institutional repositories, such as Gallica, the national digital library of France, or Sedici, the institutional repository of the National University of La Plata. In this work, we performed simulations to develop and test a strategy for exploiting surrogate sire technology in animal breeding programs. Deciding whether or not to retain the originals post-digitisation will of course not be an issue for projects digitising valuable treasures within a collection, the main issue then will be whether or not the original is too fragile to be re-scanned at a later date if the digital copy is lost.

Creating digital materials

We chose this number as it was divisible in many ways and thereby enabled several strategies to be compared and because this number was similar the 10,000 progeny that would be used by an animal breeding program that each year tested 100 candidates each with 100 progeny, a scale of progeny testing that was not uncommon in some animal breeding programs before the advent of genomic selection. The phenotype data collected to development of the management plans would also serve to further test and validate a particular donor.

Genome-Wide Estimates of Coancestry, Inbreeding and Effective Population Size in the Spanish Holstein Population. Incidentally, in this study we did not account for the cost aspects of surrogate sire technology itself. Clearly, most individual creators cannot be expected to take on a long-term commitment to preserving the digital content they create beyond that of their business needs.

A Strategy To Exploit Surrogate Sire Technology in Livestock Breeding Programs

The map of all these scenarios and used resources is summarized in.
