Advances in surgical applications of growth factors for wound healing

Williams and Holewinski 2015 reported on a small study of a limb preservation strategy that includes application of Graftjacket Regenerative Tissue Matrix. Keratinocyte-driven contraction of reconstructed human skin.

Regenerative porcine dermal collagen matrix developed by supercritical carbon dioxide extraction technology: Role in accelerated wound healing

Recombinant human-like collagen and EGF are mutually interdependent and interact to achieve a wide variety of wound repair functions. Collagen, the most abundant ECM structural protein, has excellent biocompatibility and degradability.

Advances in surgical applications of growth factors for wound healing

The factors that appear important for the constructive remodeling of ECM biol.

Skin and Soft Tissue Substitutes

Interestingly, the acellular dermal regeneration templates like Integra, MatriDerm, and AlloDerm are quite frequently used. After 1 day, the in vitro degradability in the AHA, FHA, and OFHA groups was 41. The investigators recommended further design improvements in both forms of these new mesh products.

Efficacy of a novel intradermal *Lawsonia intracellularis* vaccine in pigs against experimental infection and under field conditions

Barrientos S, Stojadinovic O, Golinko MS, Brem H, Tomic-Canic M. Then, they were washed with EGM-2 and further treated in an 80% EtOH

to remove the cell debris and lipid, resp.

Progress and opportunities for tissue

Groups were composed of pigs derived from at least 6 different sows. One animal group 2 was found dead on day 29 post-vaccination after having shown signs of depression. Several published studies have suggested increased rates of complications with the use of ADM.
