Removal of proteins from spore surfaces by pretreatment with pronase E led to 2-fold decrease in the number of adhered spores and a 7-fold decrease in the number of germinated spores on root surfaces. This relationship was consistent and did not depend on size of root system or seedling top.

Conifer

These biological species were first discovered in Finland in 1978. They require water, oxygen, minerals, support, and warmth. Millions of those delicate, microscopic root hairs wrap themselves around individual grains of soil and absorb moisture along with dissolved minerals.
