Health Survey for England (HSE)

Drafting of the manuscript: Banks, Marmot, Oldfield, Smith. Journal of Child Psychology and Psychiatry, 54: 977-985.

Scottish Health Survey

In these surveys, samples were stratified by age group and sex. Technical problems with obtaining the measurement or sample and factors that would exclude these from analysis within the survey e. The aims of the series are: to provide annual data about the nation's health; to estimate the proportion of people in England with specified health conditions; to estimate the prevalence of certain risk factors associated with these conditions; to examine differences between population subgroups in their likelihood of having specific conditions or risk factors; to assess the frequency with which particular combinations of risk factors are found, and which groups these combinations most commonly occur; to monitor progress towards selected health targets and since 1995, to measure the height of children at different ages, replacing the National Study of Health and Growth, and to monitor the prevalence of overweight and obesity in children.

Health Survey for England: Weight

The HRS began in 1991 and new cohorts have been added subsequently to maintain population representation of this age segment and respondents are reinterviewed biannually.

Health survey for England, 2012

In contrast, obesity is much higher in the United States, an across-country differential especially pronounced in the lowest education and income groups. Within this age span, the average age of both samples is identical. The best value for health examination surveys is obtained when results are reliable and represent the general population well.
