However, because of the similarities in development of the rift along its trend Woelk and Hinze, 1991; Morey and Ojakangas, 1982; Geological Society of America, 1982, it is assumed that many of the geologic contacts involving rift-related rocks are controlled by faults. Therefore, the present study also defines provinces in the subsurface on the basis of geological criteria.

GSA Today

Grenville-age events are recorded in Canada and the northeastern U. They consist mainly of shales and sandstones, the latter representing a variety of sediment-gravity flow mechanisms. The ocean that lay south of the North American Plate through much of the Paleozoic was closed by collision with Gondwana, starting in the Mid-Mississippian.

Geologic Provinces of Oklahoma

The Arbuckle is a cyclic carbonate dominated by intertidal and shallow subtidal facies. The Ozark Dome and Arkoma Basin represent a foreland uplift and foreland basin that formed as a result of the impinging Ouachita orogenic belt.
